

Solution Architecture

Title: System Design Blueprint for Salesforce Implementation

Below is the proposed **component-based architecture** that outlines the interconnections among Salesforce modules:

Key Notes:

- **Modularity:** Each object serves a specific business need
- **Reusability:** Fields like Price can be referenced in multiple objects
- **Automation:** Flows are the central mechanism for smart communication

- **Reporting Layer:** Extracts data from all custom objects for analytics

Design Goals:

- Minimize user effort through smart layouts and dependencies
- Provide full transparency into operations
- Enable future enhancements without major code changes
